Wireless router solutions

Challenges

Construction companies have tight project deadlines and need a reliable source of internet so they can use their day-to-day applications in order to avoid costly delays. Even in locations where internet connectivity is limited or under-developed, finding options for connectivity means that contractors and builders have the means to stay online, in order to get the job done. From filing project reports to accessing and sharing 3D models, construction companies need fast and reliable connectivity for the duration of their projects.

Solution

Construction companies can turn to Verizon wireless routers and the award-winning Verizon 4G LTE network, so that contractors and employees—in onsite mobile offices and those back at HQ—can communicate with ease.

Benefits

Deployment. Wireless routers leverage the power of Verizon's 4G LTE network so you can be online quickly and easily.

Time. Using wireless routers, construction workers can access their construction management system, provide 3D models to clients, manage invoicing and process change orders--with less impact to the schedule.

Coverage. With construction companies often working in remote development areas, Verizon, America's largest 4G LTE network, offers peace of mind that workers can get online from virtually anywhere a site is located.
